## **Appligent releases server edition of Redax**

OEMs customizing software for businesses and government entities who need to put the ability to redact information from PDFs in the hands of a large group of employees now have the option of administering Appligent's redaction tools from the server level. The Pennsylvania PDF software company announced this week the availability of Redax Enterprise Server.

The software can process large batches of documents and can make them compliant with the federal Freedom of Information and Privacy acts.

"Redax Enterprise Server is geared towards government agencies and our OEM partners. Using a server-based solution allows agencies to pre-process large quantities of documents by marking up keywords or phrases based on their predefined lists," says Virginia Gavin, president of Appligent. "FOIA specialists then can access these marked-up documents and continue the redaction process. This provides significant time savings in high-volume settings."
